Amendments to the Specification:

Please delete the Abstract of the invention in its entirety, and add the following new Abstract:

The invention relates to an An electronic circuit for providing a logic gate function includes a comprising differential signal input means, a combining stage, a discriminating stage and a differential signal output means. The discriminating stage comprises includes four transistors (Q8, Q9, Q10, Q11) each having first electrodes (83, 93, 103, 113) and second electrodes (81, 91, 101, 111) and a respective gate electrode (82, 92, 102, 112). The first electrodes of said the four transistors are connected to a common node. The combining stage is arranged to convert differential input signals into gate signals applied to the grating gate electrodes of some of said the four transistors respectively.
